TOSHIBA

Transistor Inverter

High-performance Inverter TOSVERT™

VF-

Flexible for you

I need the most suitable inverter for my application which has low noise. low harmonics. minimal parameter setting, high torque and control. We meet all your requirements with VF-AS1. It has outstanding Performance, including high torque, fast response, high accuracy and excellent environmental compatibility with easy operation. The VF-AS1 is an advanced inverter evolved to satisfy all your needs in one comprehensive product.

For machinery that requires simple function

Point

Point

This makes the inverter ideal for drilling machines, handling machines, conveyors, semiconductor production equipment, cutting machines, and woodworking machinery that require simple function. *1:Photos of machinery are for illustrative purposes only.

VE-ASS'

Harmonics Reduction, Power Factor Improvement Poin Effect of built-in reactor

• A compact, space-saving new type of DC reactor is built into 200 V class 11 to 45 kW and 400 V 18.5 to 75 kW models.

In addition to reducing harmonics, this reactor limits the input current to 110% of the rated output current, and it has been designed to be compatible with power supply systems containing transformers, molded-case circuit breakers, and power lines.

Adding on the optional DC reactor enables compliance with IEC harmonics standards.

High-frequency Noise Reduction Point

Built-in EMC filte

· High-frequency noise is drastically reduced on models with built-in noise filters. Built-in noise filters are ideal for sites from commercial facilities and offices through to factories where attention must be paid to peripheral devices.

Compared with filter not integrated models, space and wiring savings have been achieved by incorporating the filter in the panel. Also, models with built-in EMC noise filter comply with the European EMC Directive as individual inverter units.

European EMC Directive : IEC/EN61800-3, 1st Environment, C2 (200V-0.4 to 1.5kW 400V-0.75 to 3.7kW or IEC/EN61800-3, 2nd Environment, C3

200V class models, 0.4 to 7.5kW : EMI noise filter (complies with the European EMC Directive) built-in standard 200V class models, 11 to 45kW : Basic noise filter (not complies with the European EMC Directive) built-in standard 400V class models, 0.75 to 75kW : EMI noise filter (complies with the European EMC Directive) built-in standard 400V class models, 90 to 500kW ; EMI noise filter (complies with the European EMC Directive) built-in standard

Parameter setting macro function

Motor overload protection level 1 FM terminal meter adjustment

Parameter display selection

V/f control mode selection Maximum frequency

Acceleration time 1

Deceleration time 1

• You can customize the Quick mode display, maximum of 32 target parameters are displayed to suit your specific setup requirements.

. You can also use the EASY key as a panel/remote key to switch between panel and remote operation, and as a shortcut key to directly access any specific setup or display screen.

Easy Installation, Easy commissioning, and Easy maintenance

Side-by-side installation

maintenance easier. ON/OFF control of cooling fan

Simple Setup by EASY Key

• In the Quick mode, pressing the EASY key on the panel allows you to operate the inverter by eight basic parameters.

When setting each of the functions, press the EASY key to move to the standard mode by one-touch operation. In this mode, you can access all parameters.

 Side-by-side installation of inverters is possible up to the inverter's total capacity. This allows effective utilization of space inside control panels. Heat sink can be installed outside of the panel as an option.

Removable control terminal board

• A removable terminal board is used. This allows you to use the control wiring when replacing the inverter, which also makes

 Temperature-based ON/OFF control reduces noise while the inverter is being stopped, saves energy and extends the cooling fan's life.

Monitoring of serviceable parts/alarm output

 The expected replacement cycle of main circuit capacitors, capacitors on control board, and cooling fan is monitored, and an alarm is output when the cycle is reached.

VF-ASST

For machinery that reguires high torque and a large capacity

This makes it ideals for cranes, mining machinery, refrigerator, presses, compressers, crushing machine and other machinery that require a high torgue and large capacity.

*1: Photos of machinery are for illustrative purposes only.

For system devices that requires flexibility

Point

coilers/uncoilers.

Fast response

Excellent Motor Control Performance

- Motor constants required for vector control can be easily set by auto-tuning to enable 1:120 speed control. Moreover, the VF-AS1 also features a robust structure that is unlikely to be influenced by motor temperature.
- On inverters provided with a sensor, high-torgue operation of 200%*² from zero velocity is possible, achieving a speed control range of 1:1000.
- High-speed response frequencies of 40 Hz without sensor and 50 Hz with sensor are achieved respectively, to maintain fixed speed in response to sudden changes in load.
- Modifying software enables high-frequency output up to 1000 Hz, which is ideal for spindle rotation of woodworking and metalworking machinery.
- *2: When a TOSHIBA standard 3-phase, 0.4 to 3.7 kW 4-pole motor are driven

Fast recovery against

impact load

Brake sequence/light-load, high-speed functions

• The inverter has two built-in functions, the brake sequence function and light-load, high-speed function, as standard. The brake sequence function measures the timing with braking by an external motor to achieve smooth operation at start and stop of braking operation. The light-load, high-speed function automatically increases the speed when operating light loads according to the lifting load to improve conveyance efficiency. A learning function for setting and storing to memory required parameters while performing actual operations is also provided to facilitate adjustments.

Built-in transistor for dynamic braking

• The VF-AS1 has a built-in transistor for dynamic braking up to 160 kW, which makes it ideal for lifting applications.

Customizing by "My Function"

ith "My function", you can create programs containing to 28 steps. This achieves logic operations and internal ta operations. Parameters can also be set according to alog input and minimum-peak hold of analog outputs. or example:

- x.1) Inverter is automatically switched to commercial operation without the external sequence when the inverter is tripped.
- x.2) A signal is output when torque reaches 120% and frequency is 5 Hz.
- x.3) "Forward rotation operation," "preset-speed operation frequency 3" and "No.2 acceleration/deceleration" are simultaneously turned ON by input on a single terminal.
- x.4) The acceleration/deceleration time is changed dynamically by a voltage within the range 0 to 10 V.

RS-485 communications

• RS-485 communications is equipped as standard, and Modbus-RTU protocol is supported in addition to TOSHIBA protocol.

Network options

• Use of communication options enables support of DeviceNet*2, PROFIBUS and CC-Link and other main fieldbuses.

Data tracing

- The PCM001Z communications software allows you to edit, monitor, and trace parameter data on a PC, enabling easier data management from inverter startup through to maintenance.
- *2: DeviceNet is a registered trademark of ODVA (Open DeviceNet Vendor Association)

vF-AS'1

For machinery that requires expansion

Outstanding Lineup of Options

LCD Extension Panel Option

This panel is an 23-character x 8-line display, and can be used for simple setup and monitoring by selection of parameters using the jog dial. The display language can be switched between English and Japanese. (German, Italian, Spanish, and Chinese will be available soon.) Type: RKP004Z

T	op 🖬 🖽	

* The photograph shows a screen currently in development.

LED Extension Panel Option

Expanded Terminal Block Option Fieldbus Option

Encoder Feedback Option

Our customers require a "display that is easily visible from a long way away." In response to this need, we developed this panel using 20 mm LEDs, the largest in its class in the market, to ensure outstanding visibility.

It has also been designed to be fitted into panels for use as an extension panel or display. In addition, it can be used as a parameter copy and is capable of storing parameters for up to three models. Type: RKP002Z

This I/O terminal block can be added on to enhance your system for extra compatibility with a wide range of systems:

- Contact inputs (4)
 Analog outputs (2)
 PTC input (1)
 Relay output (1 circuit)
 Pulse train input (1)
- Type: ETB003Z, ETB004Z

Main fieldbuses are supported to enable connection to a host controller to achieve savings in space and centralized control of systems.

- DeviceNet*1
 Type: DEV002Z
 PROFIBUS
 Type: PDP002Z
- CC-Link
 Type: CCL001Z
- *1 DeviceNet is a registered trademark of ODVA (Open DeviceNet Vendor Association).

Three encoder feedback options are provided to match output for support of vector control with a sensor.

- Line driver output (RS-422) ,Type: VEC007Z
- Open collector/complimentary output (12 V) ,Type: VEC004Z
- Open collector/complimentary output (15 V) ,Type: VEC005Z

Wide Range of Applications Point 10 Safety Environmental Compatibility Ambient temperature 60°C derating current. **Eco Design** Various Drive Performance Permanent Magnet Motor (PM) Drive High-frequency 1000 Hz Output **New DC Braking A Further Enhanced of Functions Multi-PID Control** Traverse Power interruption synchronized control • Drooping Speed gain switching Zero speed lock Dwell

vF-AS'I

The VF-AS1 can be used at a rating up to an ambient temperature of 50° C and in environments up to 60° C at a derating current.

88% of materials used on the VF-AS1 are recyclable, which design more than meets of the European WEEE (Waste Electrical and Electronic Equipment) Directive of 70%.

The PM is driven efficiently by a TOSHIBA oriented control argorithm to achieve savings in energy and space.

Software modification increases output up to a high frequency of 1000 Hz, making it ideal for woodworking and metalworking machinery.

A newly developed DC braking function allows the stop time to a quarter of that on conventional models.

As well as process-type PID control (e.g. temperature, pressure, flow rate), the VF-AS1 incorporates speed-type PID control that is compatible with speed feedback, for example, in follow-up operation or winding, for line compatibility with line control.

Two extra controls are achieved, traverse control during rewinding that is mandatory on fabric machinery, and power interruption synchronized control for preventing thread breakage when a power interruption occurs.

Drooping distributes the load of 2-shaft drive on conveyance machinery, for example. Speed gain switching enables adaptation to changes in inertia during operation. Zero speed is hold when the inverter is stopped. And dwell controls acceleration/deceleration, for example, when conveying heavy loads.

VF-AS

Basic functions

Each "setup item" that determines the control characteristics of the inverter is called a "parameter." For example, to change the acceleration time, you choose the acceleration time parameter (titled " $R \subseteq \zeta$ ").

Quick mode (EASY)

To enter the Quick mode, press the EASY key on the panel. In this mode, you can set eight of the basic parameters.

· · □ □·/	Title	Function

Bui	It-in Filter	EMI noise filter Note 7)											
DC	Reactor				A	ttached DC	reactor Note	5)					

Note 1) Capacity is calculated at 220V for the 200V models and at 440V for the 400V models.

Note 2) Indicates the value when the PWM carrier frequency (parameter [F]) is 2.5 kHz or less.

When low noise (PWM carrier frequency 8 kHz) is required at 18.5 kW or more, use an inverter of capacity one rank higher than the motor capacity

Note 3) $\pm 10\%$ when the inverter is used continuously (load of 100%)

Note 4) Inverters, 18.5kW or greater, do not have wiring port covers. They have large openings, but there is no space to bend the external cables inside the unit. If they are fitted external to the cabinet, please use an optional wiring port cover.

Note 5) For 200V-55kW, 400V-90kW or larger model, be sure to install DC reactor.

However, this is unnecessary for DC input specifications.

Note 6) Three-phase 380~480V-50/60Hz for 4900PC Note 7) Complies with the European EMC Directive

IEC/EN61800-3, 2nd environment, category C3

Common Specifications

	lte	m	Specification								
	Control syster	m	Sinusoidal PWM control								
	Output voltage	e adjustment	Main circuit voltage feedback control. (Switchable between automatic adjustment/fix/control off)								
	Output freque	ncy range	Setting between 0.01 to 500Hz. Default max. frequency is set to 0.01 to 60Hz. Maximum frequency adjustment (30 to 500Hz)								
	Minimum setti	ing steps of frequency	0.01Hz: operation panel input (60Hz base), 0.02Hz: analog input (60Hz base, 11 bit/0 to 10Vdc)								
s	Frequency ac	curacy	Within ±0.2% (25°C±10°C): analog input ±0.01% (25°C±10°C): digital input								
fication	Voltage/freque	ency characteristics	V/f constant, square reduction torque control, automatic torque boost, vector calculation control, base frequency adjustment 1, 2, 3, and 4 (25 to 500Hz), V/F 5-point arbitrary setting, torque boost adjustment (0 to 30%), start frequency adjustment (0 to 10Hz), stop frequency adjustment (0 to 30Hz)								
Control speci	Frequency se	tting signal	3kΩ potentiometer (possible to connect to 1 to 10kΩ-rated potentiometer) 0 to 10Vdc (input impedance Zin: 30kΩ) 0 to ±10Vdc (Zin: 22kΩ) 4 to 20mAdc (Zin:242Ω)								
	Terminal boar	d base frequency	The characteristic can be set arbitrarily by two-point setting. Compliant with 6 types of input; analog input (RR, VI/II, RX, RX2), pulse input and binary/BCD input (*RX2, binary/BCD input; optional)								
	Frequency jur	np	3 places. Setting of jump frequency and width.								
	Upper and lov	ver limit frequencies	Upper limit frequency: 0 to max. frequency, lower limit frequency: 0 to upper limit frequency								
	PWM carrier t	requency	200V-45kW or less, adjustable between 1.0 to 16kHz for 400V-/skW or less200V-55kW or less, adjustable between 1.0 to 16kHz for 400V-90kW or more								
	Torque contro	1	Adjustment of propriorial gain, integratione, and end of the second seco								
	Acceleration/c	deceleration time	0.01 to 6000 sec. Selectable from among acceleration/deceleration. times 1, 2, 3 and 4. Automatic acceleration/deceleration function. S-pattern acceleration/deceleration 1 and 2 pattern adjustable.								
	DC braking		Adjustment of braking start frequency (0 to 120Hz), braking (0 to 100%) and braking time (0 to 10 sec.). With emergency stop braking function and motor shaft fix control function.								
	Forward run/r	everse run Note 1)	With F-CC closed to forward run, with R-CC closed to reverse run, with both closed to reverse run. With ST-CC opened to coast stop. Emergency stop by panel operation or terminal board.								
su	Jog run Note	1)	Jog mode, if selected, allows jog operation from the operation panel Jog run operation by terminal board is possible by setting the parameters.								
cificatio	Preset speed	operation Note 1)	By changing the combination of open/close between S1, S2, S3, RR/S4-CC, set frequency + 15-speed operation. Selectable between acceleration/deceleration time, torque limit and V/f by set frequency.								
spec	Retry		Capable of restarting after a check of the main circuit elements in case the protective function is activated. Max. 10 times selectable arbitrarily. Waiting time adjustment (0 to 10 sec.)								
ation	Cooling fan O	N/OFF	Automate to de reduction control at overtadatility. Cleratili. Or Fig. View of the second reduction control at overtadatility to assure long life when unnecessary.								
Opera	Operation par	nel key operation ON/OFF	Key prohibition selectable between Stop key only, Mode key only, etc. All key operations can be prohibited.								
	Regenerative	power ride-through control	Possible to keep the motor running using its regenerative energy in case of a momentary power failure. (Default: OFF)								
	Auto-restart o	peration	Possible to restart the motor in coasting in accordance with its speed and direction. (Default: OFF)								
	Simplified pat	tern operation	Possible to select each 8 patterns in 2 groups from 15-speed operation frequency. Max. 16 types of operation possible. Terminal board operation/repeat operation possible.								
	Light-load hig	h-speed operation	Possible to switch operation by commenciar power source or inverter Increases the operation of ficiency of the machine by increasing the rotational speed of the motor when it is operated under light load.								
	Drooping fund	tion	When two or more inverters are used to operate a single load, this function prevents load from concentrating on one inverter due to unbalance.								
	Override function	tion	External input signal adjustment is possible to the operation frequency command value.								
ve function	Protective function		Stall prevention, current limit, overcurrent, overvoltage, short circuit on the load side, ground fault on the load side (Note 5), undervoltage, momentary power failure (15ms or more), non-stop control at momentary power failure, overload protection, arm overload at starting, overcurrent on the load side at starting, overcurrent and overload at dynamic braking resistance, fin overheat, emergency stop								
otecti	Electronic the	rmal characteristic	Switchable between standard motor/constant torque VF motor, adjustment of overload protection and stall prevention level.								
Ę.	Reset	A1	Reset by 1a contact closed (or 1b contact opened), or by operation panel. Or power source OFF/ON. This function is also used to save and clear trip records.								
	-	Alarms	Stail prevention during operation, overload limit, overload, undervoitage on power source side, but circuit undervoitage, setting error, in retry, upper limit, lower limit.								
S		Causes of failures	Develoantent, overvoltage, in overleat, shot cloud of the load side, ground rate of the load side, inverted overload, and overcurrent a starting, overcurrent of the load side at starting, EEPROM error, RAM error, RAM error, RAM error, RAM error, (dynamic braking resistor overcurrent/overload), (emergency stop), (undervoltage), (low current), (overtorque), (motor overload), (output phase failure) The items in the parentheses are selectable.								
Display functior	4-digit and 7-segment LED	Monitoring function	Operation frequency, operation frequency command, forward run/reverse run, output current, DC voltage, output voltage, compensated frequency, terminal board input/output information, CPU version, control EEPROM version, past trip history, cumulative operation time, speed feedback, torque, torque command, torque current, exiting current, PID feedback value, motor overload factor, inverter overload factor, PBR overload factor, PVBR load factor, input power, output power, peak output current, peak DC voltage, Motor counter pseudo PG, position pulse, RR input, V/II input, RX2 input, RM output, Md output, meter adjustment fix output, flash memory version, main circuit EEPROM version, types of connection option, previous default setting, previous automatic control (AU2)								
		Free unit display	Display of optional units other than output frequency (motor speed, line speed, etc.), current ampere/% switch, voltage volt/% switch								
	-	User default setting	Seatches advortaciany parameters that are unerent more the standard details setting parameters, casy to mit changed parameters.								
	LED	Charge display	Displays main circuit capacitor charging.								
Inpu	t/output termin	al input function	Possible to select positive logic or negative logic with programmable input/output terminal function menu. Note 1: Note 2: (Default setting: positive logic)								
Sink	/source switchi	ing	Possible to switch between minus common (CC) and plus common (P24) for control terminal. (Default setting: minus common (CC))								
	Failure detecti	on signal	1c contact output (250vac-2A-cost=1, 250vac-1A-cost=0.4, 30vac-1A) Contact output (250vac-2A-cost=1, 250vac-1A-cost=0.4, 30vac-1A) Contact output (240vac-2A-cost=1, 250vac-1A-cost=0.4, 30vac-1A) Contact output (250vac-2A-cost=1, 250vac-1A-cost=0.4, 30vac-1A) Contact output (250vac-1A-cost=0.4, 30vac-1A-cost=0.4, 30vac-1A-cost=0								
t signal	Upper/lower lin	nit frequency signal output	Open collector output (24Vdc, max. 50mA, output impedance: 33Ω)								
Outpu	Output for frequ	uency meter/output for ammeter	Analog output. 1mAdc full-scale DC ammeter or 7.7Vdc-1mA voltmeter								
	Pulse train fre	quency output	Open collector output (24Vdc, max. 50mA)								
Com	nmunication fur	nction	RS-485 standard 2-channel equipped (connector: modular 8P)CC-Link, DeviceNet and PROFIBUS-DP are optional.								
onts	Operating env	ironments	Indoor use. Altitude: 3000m or less (current reduction necessary if 1000m or more.) Place not exposed to direct sunlight and free of corrosive and explosive gases.								
nme	Storage tomor	erature	-10 to 100 C (nemove the upper cover in 40 C of more, max. or C) Note 4.								
nviro	Relative humio	dity	20 to 93% (free from condensation)								
Ű	Vibration		5.9m/s ² {0.6G} or less (10 to 55Hz) (Compliant with JIS C0040)								
lote	1: 16 contac	ct input terminals (of whic	h 8 are options) are programmable contact input terminals, and they make it possible to arbitrarily select from 136 types of signals.								
Vote Vote	2: Program 3: Program	mable ON/OFF output ter	minals make it possible to arbitrarily select from 150 types of signals.								

Note 4: When using inverters where the ambient temperature will rise above 50°C, remove the upper cover and operate each inverter at a current lower than the rated one. Note 5: This function protects inverters from overcurrent due to output circuit ground fault.

Standard connection diagrams

Remove this shorting bar when installing a DC reactor (DCL).

- For 200 V 55 kW or more, and 400 V 90 kW or more models, be sure to install the DC reactor.
- *2: The DC reactor is built in for models 200V-11kW~45kW and 400V-18.5kW~75kW.
- *3: The noise filter is built in for models 200V-45kW or smaller and all of 400V.
- *4: External braking resistor (option). Dynamic braking drive circuit built-in (GTR7) as standard for models 160kW or smaller
- *5: Power generation braking Unit (option). When the external braking resistor (optional) is used on 200 kW or more models, the separate power braking unit (optional) is required.
- *6: To supply a DC power, connect the cables to the PA/+ and PA/- terminals.
- *7: If you want to use a DC power supply to operate the inverter (200V: 18.5kW or more, 400V: 22kW or more), be sure to contact your supplier customer support center, because an inrush current limiting circuit is required in such a case.
- *8: For models 200V-75kW and 400V-110kW or larger, three-phase power input is necessary to drive the fan if you want to use a DC power supply.
- *9: The functions assigned to terminals OUT1, VI/VII and RR/S4 can be switched by changing parameter settings.
- *10: To supply control power from an external power supply for backing up the control power supplied from the inverter, an optional control power backup device (CPS002Z) is required. In such a case, the backup device is used at the same time with the internal power supply of the inverter
- *11: The optional control power backup unit can be used with both 200V and 400V models.

Terminal functions

Main circuit terminal

Terminal Symbol	Terminal Function
•	Grounding terminal for inverter casing
R/L1, S/L2, T/L3	200V class: 0.4~45kW Three-phase 200~240V-50/60Hz 55kW, 75kW Three-phase 200~220V-50Hz Three-phase 200~240V-60Hz
U/T1, V/T2, W/T3	Connect to a (3-phase induction) motor.
PA/+, PB	Connect a braking resistor. (For the optional dynamic brak Change the parameters Pb , Pbr and $PbLP$ if necessary. 200kW models and smaller are not equipped with termina to purchase a braking unit separately.
PC/-	This is a negative potential terminal in the internal DC ma
PO, PA/+	Terminals for connecting a DC reactor (DCL: optional exte smaller, 400V: 75kW or smaller). Before installing DCL, re
RO, SO, TO	200V class: 75kW 400V class:110kW~500kW Inverter's cooling power input terminals. When using a DC

Control circuit terminal

erminal Symbol	Input/output	Fu	nction	Electrical Specifications				
F	Input	nput	Shorting across F-CC causes forward rotation; open causes deceleration stop. (Across ST-CC is short state.)					
R	Input	ontact i	Shorting across R-CC causes reverse rotation; open causes deceleration stop. (Across ST-CC is short state.)	Voltage free contact input 24Vdc-5mA or less				
ST	Input	able co	The motor is on standby if ST and CC are connected. It coasts to a stop if this connection is broken. This terminal can be used for interlocking.	Lan current signal. Choose low current contacts to avoid poor attaching.				
RES	Input	rogramm	Shorting and then opening RES-CC cancels the status held by an inverter protective function. When the inverter is operating normally, shorting and then opening RES-CC produces no effect.	* Sink/source selectable with SW1 Sink input Source input ON :Less than DC10V ON :DC11V or more OFF :DC16V or more OFF :DC16V or more

The terminal function settings can be changed according to the application.

For inverter users

When studying how to use our inverters

Notes

Leakage current

This inverter uses high-speed switching devices for PWM control. When a relatively long cable is used for power supply to an inverter, current may leak from the cable or the motor to the ground because of its capacitance, adversely affecting peripheral equipment. The intensity of such a leakage current depends on the PWM carrier frequency, the lengths of the input and output cables, etc., of the inverter. To prevent current leakage, it is recommended to take the following measures.

[Effects of leakage current]

Leakage current which increases when an inverter is used may pass through the following routes:

- Route (1) ... Leakage due to the capacitance between the ground and the noise filter
- Route (2) ... Leakage due to the capacitance between the ground and the inverter Route (3) ... Leakage due to the capacitance between ground and the cable connecting
- the inverter and the motor Route (4) ... Leakage due to the capacitance of the cable connecting the motor and an inverter in
- another power distribution line Route (5) ... Leakage through the grounding line common to motors

Route (5) ... Leakage through the grounding line common to motors Route (6) ... Leakage to another line because of the capacitance of the ground Leakage current which passes through the above routes may cause the following trouble.

 Malfunction of a leakage circuit breaker in the same or another power distribution line

- Malfunction of a ground-relay installed in the same or another power distribution line
- Noise produced at the output of an electronic device in another power distribution line
- Activation of an external thermal relay installed between the inverter and the motor, at a current below the rate current

[Measures against effects of leakage current]

The measures against the effects of leakage current are as follows:

- 1) Measures to prevent the malfunction of leakage circuit breakers
- (1) Decrease the PWM carrier frequency of the inverter. Note)
- (2) Use radio-frequency interference-proof ELCBs (manufactured by Toshiba Schneider Inverter Corporation) as ground-fault interrupters in not only the system into which the inverter is incorporated but also other systems. When ELCBs are used, the PWM carrier frequency needs to be increased to operate the inverter.
- (3) When connecting multiple inverters to a single ELCB, use an ELCB with a high current sensitivity or reduce the number of inverters connected to the ELCB.
- 2) Measures against malfunction of ground-fault relay:

(1) Decrease the PWM carrier frequency of the inverter. Note)

- (2) Install ground-fault relays with a high-frequency protective function (e.g., Toshiba CCR12 type of relays) in both the same and other lines. When ELCBs are used, the PWM carrier frequency needs to be increased to operate the inverter.
- Measures against noise produced by other electric and electronic systems:
 Separate the grounding line of the inverter from that of the affected electric and electronic systems.
- (2) Decrease the PWM carrier frequency of the inverter. ^{Note)}
- 4) Measures against malfunction of external thermal relays:
- (1) Remove the external thermal relay and use the electronic thermal function of the inverter instead of it. (Unapplicable to cases where a single inverter is used to drive more than one motor. Refer to the instruction manual for measures to be taken when thermal relays cannot be removed.)
 (2) Decrease the PWM carrier frequency of the inverter. Note)
- 5) Measures by means of wiring and grounding
- (1) Use a grounding wire as large as possible.
- (2) Separate the inverter's grounding wire from that of other systems or install the grounding wire of each system separately to the grounding point.
 (3) Ground (shield) the main circuit wires with metallic conduits.

(4) Use the shortest possible cables to connect the inverter to the motor.(5) If the inverter has a high-attenuation EMI filter, turn off the grounding capacitor detachment switch to reduce the leakage current. Note that doing so leads to a reduction in the noise attenuating effect.

Note) In the case of this inverter, the PWM carrier frequency can be decreased to 1.0kHz. However, that it should not be set to less than 2.0kHz during vector control. Decreasing the carrier frequency results in an increase in electromagnetic noise from the motor.

Ground fault

Before begining operation, thoroughly check the wiring between the motor and the inverter for incorrect wiring or short circuits. Do not ground the neutral point of any star-connected motor.

Radio interference

[Noise produced by inverters]

Since this inverter performs PWM control, it produces noise and sometimes affects nearby instrumental devices, electrical and electronic systems, etc. The effects of noise greatly vary with the noise resistance of each individual device, its wiring condition, the distance between it and the inverter, etc.

[Measures against noises]

According to the route through which noise is transmitted, the noises produced by an inverter are classified into transmission noise, induction noise and radiation noise. [Examples of protective measures]

- Separate the power line from other lines, such as weak-current lines and signal lines, and install them apart from each other.
- Install a noise filter in each inverter. It is effective for noise prevention to install noise filters in other devices and systems, as well.
- Shield cables and wres with grounded metallic conduits, and cover electronic systems with grounded metallic cases.
- Separate the power distribution line of the inverter from that of other devices and systems.
- Install the input and output cables of the inverter apart from each other.
 Use shielded twisted pair wires for wiring of the weak-current and signal circuits.
- and always ground one of each pair of wires. • Ground the inverter with grounding wires as large and short as possible,
- separately from other devices and systems. On 200V 0.4 to 7.5kW and 400V 0.75 to 75kW models, noise can be greatly

reduced as they have a built-in EMI noise filter on their input side.

Power factor improvement capacitors

Do not install a power factor improvement capacitors on the input or output side of the inverter.

Installing a power factor improvement capacitor on the input or output side causes current containing harmonic components to flow into the capacitor, adversely affecting the capacitor itself or causing the inverter to trip. To improve the power factor, install an input AC reactor or a DC reactor (optional) on the primary side of the inverter.

Installation of input AC rectors

These devices are used to improve the input power factor and suppress high harmonic currents and surges. Install an input AC reactor when using this inverter under the following conditions:

- (1) When the power source capacity is 500kVA or more, and when it is 10 times or more greater than the inverter capacity.
- (2) When the inverter is connected the same power distribution system as a thyristor-committed control equipment.
- (3) When the inverter is connected to the same power distribution system as that of distorted wave-producing systems, such as arc furnaces and large-capacity inverters.

When wiring the inverter

(Wiring precautions)

Installing a molded-case circuit breaker [MCCB]

- Install a molded-case circuit breaker (MCCB) on the inverter's power supply input to protect the wiring.
- (2) Avoid turning the molded-case circuit breaker on and off frequently to turn on/off the motor.
- (3) To turn on/off the motor frequently, close/break the control terminals F (or R)-CC.

Installing a magnetic contactor [MC] [primary side]

- (1) To prevent an automatic restart after the power interruption or overload relay has tripped, or actuation of the protective circuit, install an electro-magnetic contact in the power supply.
- (2) The inverter is provided with a failure detection relay (FL), so that, if its contacts are connected to the operation circuit of the magnetic contactor on the primary side, the magnetic contactor will be opened when the protective circuit of the inverter is activated.
- (3) The inverter can be used without a magnetic contactor. In this case, use an MCCB (equipped with a voltage tripping device) for opening the primary circuit when the inverter protective circuit is activated.
- (4) Avoid turning the magnetic contactor on and off frequently to turn on/off the motor.
- (5) To turn on/off the motor frequently, close/break the control terminals F (or R)-CC.

Installing a magnetic contactor [MC] [secondary side]

- (1) As a rule, if a magnetic contactor is installed between the inverter and the motor, do not turn of ON/OFF while running. (If the secondary-side contactor is turned of ON/OFF while running, a large current may flow in the inverter, causing inverter damage and failure.)
- (2) A magnetic contactor may be installed to change the motor or change to the commercial power source when the inverter is stopped. Always use an interlock with the magnetic contactor in this situation so that the commercial power supply is not applied to the inverter's output terminals.

External signal

- (1) Use a relay rated for low currents. Mount a surge suppressor on the excitation coil of the relay.
- (2) When wiring the control circuit, use shielded wires or twisted pair cables.
- (3) Because all of the control terminals except FLA, FLB and FLC are connected to electronic circuits, insulate these terminals to prevent them from coming into contact with the main circuit.

Installing an overload relay

- (1) The VF-S11 inverter has an electronic-thermal overload protective function. However, in the following cases, the thermal relay operation level must be adjusted or an overload relay matching the motor's characteristics must be installed
- between the inverter and the motor. (a) When using a motor having a rated current value different from that of the equivalent.
- (b) When driving several motors simultaneously.
- (2) When using the inverter to control the operation of a constant-torque motor (VF motor), change the protective characteristic of the electronic thermal relay according to the setting of the VF motor.
- (3) In order to adequately protect a motor used for low-speed operation, we recommend the use of a motor equipped with a embedded thermal relay.

When changing the motor speed

(Application to standard motors)

Vibration

When a motor is operated with an industrial inverter, it experiences more vibrations than when it is operated by the commercial power supply. The vibration can be reduced to a negligible level by securing the motor and machine to the base firmly. If the base is weak, however, the vibration may increase at a light load due to resonance with the mechanical system.

Reduction gear, belt, chain

Note that the lubrication capability of a reducer or a converter used as the interface of the motor and the load machine may affected at low speeds.

When operating at a frequencies exceeding 60 Hz or higher, power transmission mechanisms such as reduction gear, belts and chains, may cause problems such as production of noise, a reduction in strength, or shortening of service life.

Frequency

Before setting the maximum frequency to 60 Hz or higher, confirm that this operating range is acceptable for the motor.

(Application to special motors)

Braking motor

When using a braking motor, if the braking circuit is directly connected to the inverters's output terminals, the brake cannot be released because of the lowered starting voltage. Therefore, when using a braking motor, connect the braking circuit to the inverter's power supply side, as shown on the below. Usually, braking motors produce larger noise in low speed ranges.

Gear motor

When using an industrial inverter to drive a gear motor, inquire of the motor manufacturer about its continuous operation range, since low-speed operation of a gear motor may cause insufficient lubrication.

Toshiba Gold Motor (High-efficiency power-saving motor)

Inverter-driven operation of Toshiba Gold Motors is the best solution for saving energy. This is because these motors have improved efficiency, power factor, and noise/vibration reduction characteristics when compared to standard motors.

Pole-changing motor

Pole-changing motors can be driven by this inverter. Before changing poles, however, be sure to let the motor come to a complete stop.

Hight-pole-count motors

Note that hight-pole count motors(8 or more poles), which may be used for fans,etc., have higher rated current than 4-pole moters. The current ratings of multipole motors are relatively high. So, when selecting an

inverter, you must pay special attention to its current rating so that the current rating of the motor is below that of the inverter.

Single-phase motor

Because single-phase motors are equipped with a centrifugal switch and capacitors for starting, they cannot be driven by an inverter. If only a single-phase, power system is availabls a 3-phase motor can be driven by using a single-phase input interter to convert it into a 3-phase 200V output. (A special inverter and a 3-phase motor are required.)

Note 1) Indicates the recommended model No. of product made by Toshiba Schneider Electric Ltd. Note 2) Selections for use of the Toshiba 4-pole standard motor with power supply voltage of 200V/400V-50Hz

Note 2) Selections for use of the Toshiba 4-pole standard motor with power supply voltage of 200V/400V-50Hz.
Note 3) Choose the MCCB according to the power supply capacity.
For comply with UL and CSA standard, use the fuse certified by UL and CSA.
Note 4) When the motor is driven by commercial power supply switching, for example, use an electromagnetic contactor that is matched to AC-3 class motor rated current.
Note 5) Attach surge killers to the magnetic contactor and exciting coil of the relay.
Note 6) In the case the magnetic contactor (MC) with 24-type auxiliary contracts is used for the control circuit, raise the reliability of the contact by using 2a-type contacts in parallel connection.
Note 7) 600 V HIV insulated electrical lead is indicated as the power lead type, and electrical lead R, S and T on the input side and U, V and W on the output side are indicated as the size of the electrical lead on the main circuit. Limit the wiring distance between the inverter and the motor to 30 m. When the wiring exceeds 30 m, increase the size of the electrical lead.
Note 8) For the control circuit, use shielded wires whose size (cross-section) is 0.75 mm² or more.
Note 9) The screw size of the control circuit, and WT3 of the VFAS1-2550 to 2750P, and 4900PC to 4132KPC are M10.
Note 11) This is the recommended electrical lead size when an external braking resistor is used. For details on electrical lead size of braking resistors for high frequency regeneration, consult us separately.
Note 12) On 200 V class 55 kW or more, and 400 V class 110 kW or more models, be sure to install the DC reactor (option).

Selecting the Capacity (model) of the Inverter

(selection)

Refer to the applicable motor capacities listed in the standard specifications. When driving a high-pole motor, special motor, or multiple motors in parallel, select such an inverter that the sum of the motor rated current multiplied by 1.05 to 1.1 is less than the inverter's rated output current value.

Acceleration/deceleration times The actual acceleration and deceleration times of a motor driven by an inverter are determined by the torque and moment of inertia2 of the load, and can be calculated by the following equations. The acceleration and deceleration times of an inverter can be set individually. In any case, however, they should be set longer than their respective values determined by the following equations.

Acceleration time	$ta = \frac{(JM+JL) \times \Delta N}{9.56 \times (TM-TL)} \text{ (sec.)}$
Deceleration time	$ta = \frac{(JM + JL) \times \Delta N}{9.56 \times (TB + TL)} \text{ (sec.)}$
Conditions	JM :Moment of inertia of motor (kg m ²) JL <td:moment (kg="" inertia="" load="" m<sup="" of="">2) (converted into value on motor shaft) ΔN :Difference in rotating speed between before and after acc. or dce. (min.⁻¹) TL :Lad torque (N.m) TM :Motor rated torque x 1.2-1.3 (N.m) V/f control :Motor rated torque x 0.2 (N.m) TB :Motor rated torque x 0.2 (N.m) (When a braking resistor or a braking resistor unit is used:) (Motor rated torque x 0.2-1.0 (N.m)</td:moment>

Allowable torque characteristics

When a standard motor is combined with an inverter to perform variable speed operation, the motor temperature rises slightly higher than it normally does during commercial power supply operation. This is because the inverter output voltage has a sinusoidal (approximate) PWM waveform. In addition, the cooling becomes less effective at low speed, so the torque must be reduced according to the frequency.

When constant-torque operation must be performed at low speeds, use a Toshiba VF motor designed specifically for use with inverters.
Starting characteristics

When a motor is driven by an inverter, its operation is restricted by the inverterAfs overload current rating, so the starting characteristic is different from those obtained from commercial power supply

Although the starting torque is smaller with an inverter than with the commercial power supply, a high starting torque can be produced at low speeds by adjusting the V/f pattern torque boost amount or by employing vector control. (200% in sensorless control mode, though this rate varies with the motor characteristics.) When a larger starting torque is necessary, select an inverter with a larger capacity and examine the possibility of increasing the motor capacity.

Harmonic current and influence to power supply

Harmonics are defined as sinusoidal waves that is multiple frequency of commercial power (base frequency: 50Hz or 60Hz). Commercial power including harmonics has a distorted waveform.

Some electrical and electronic devices produce distorted waves in their rectifying and smoothing circuits on the input side. Harmonics produced by a device influence other electrical equipment and facilities in some cases (for example, overheating of phase advancing capacitors and reactors).

		Function/	Purpose, etc.						
	This is used to improve the input power factor of the inverter power supply, reduce harmonics or suppress external surges. Install this option when the power supply capacity is 500 kVA or more and the power supply capacity is 10 times or more than that of the inverter's capacity, or when a distortion-generating source such as a thyristor or a large-capacity inverter is connected to the same wiring leads. The effect of this option changes according to the impedance of the reactor. Consult us separately for details.								
]						
	Reactor	Improved Power Factor	Harmonics	External Surge Suppression					
	Input AC Reactor	0	0	0	⊖very: very effective				
	DC Reactor	⊖very	○: effective ×: ineffective						
	The DC reactor is more effective than the input reactor in improving the power factor. We recommend joint use of the input reactor, that is effective in suppressing external surges, when facilities where the inverter is to be applied require high reliability.								
tion type e by c Co., Ltd.	200 V - 7.5 kW or less, and 400 V - 75 kW or less models have a built-in high-attenuation noise filter. However, use this filter when noise must be suppressed even more. • This is effective in preventing radio wave interference on audio equipment used near the inverter. • Install it on the input side of the inverter. • It is effective in attenuating in a wide range from AM radio bands through to 10 MHz. • Use it whene enumment that is suscentible to noise is installed nearby.								
ter) e made Electronics	 This is effective in preventing radio wave interference on audio equipment used near the inverter. Install it on the input side of the inverter. This option is effective in attenuating only specific frequency bands. It is useful as a noise countermeasure for specific AM radio stations (where radio waves are weak, for example, in mountain areas). Current leakage increases as it is a capacitor type. Avoid use of many of these options when an ELCB is installed on the power supply side. 								
eactor er) e made by c Co., Ltd.	This is effective in preventing radio wave interference on audio equipment used near the inverter. This is also effective in reducing noise on the input side and output side of the inverter. It has attenuation characteristics of several dB from AM radio bands through to frequency bands up to 10 MHz.								
pliant r et)	This high-attenuation type EMC noise filter takes up little space, and adopts a system (foot mount or side mount) that mounting on the rear or side of the inverter (separate-standing for large-capacity class models).								
	This operation is used when sudden deceleration or stops are frequently performed, or when the deceleration time must be shortened on loads having a large inertia. This resistor is for taking up energy during power generation braking.								
n filter	On systems that run 400 V class general-purpose motors by voltage-type PWM system inverters using ultra high-speed switching devices (e.g. IGBT), surge voltage, that is dependent on cable length, cable laying methods, cable constants, and other factors, sometimes causes the insulation of the motor winding to deteriorate. For this reason, measures for suppressing surge voltage are performed by installing a DC reactor or surge suppression filter on the inverter output end where the insulation-reinforced motor is used.								
ly	Control power need not be input separately as it is supplied internally on the inverter from the main circuit power supply. Use this option when backing up only by the control power supply when the main circuit is shut off. This is +24 VDC output common to both 200 and 400 V models. (Type : CPS001Z)

Measures for suppressing higher harmonics

No	Measures	Description
1	Connecting a reactor	The leakage of a harmonic current from an inverter can be restricted by connecting an input AC reactor (ACL) on the input side of the inverter or a DC reactor (DCL) to the DC section of the inverter.
2	Connecting a higher harmonic suppressing unit (SC7)	A PWM converter that shapes the waveform of an input current into a substantially sinusoidal waveform. The leakage of a harmonic current from a power supply can be restricted by connecting a harmonic suppressing unit (SC7).
3	Connecting a higher harmonic suppressing phase advancing capacitor	A harmonic current can be absorbed by the use of a phase advancing capacitor unit composed of a phase advancing capacitor and a DC reactor.
4	Multi-pulse operation of transformation	For delta-delta connection and delta-Y connection transformers, the effect of 12 pulses can be obtained by distributing the load evenly, and thus currents containing fifth-order and seventh-order harmonics can be suppressed.
5	Other measures	Harmonic currents can also be suppressed by the use of passive (AC) and active filters.

To users of our inverters : Our inverters are designed to control the speeds of three-phase induction motors for general industry.

- * Read the instruction manual before installing or operating the inverter unit and store it in a safe place for reference.
- * When using our inverters for equipment such as nuclear power control, aviation and space flight control, traffic, and safety, and there is a risk that any failure or malfunction of the inverter could directly endanger human life or cause injury, please contact our headquarters, branch, or office printed on the front and back covers of this catalogue. Special precautions must be taken and such applications must be studied carefully.
- * When using our inverters for critical equipment, even though the inverters are manufactured under strict quality control always fit your equipment with safety devices to prevent serious accident or loss should the inverter fail (such as issuing an inverter failure signal).
- * Do not use our inverters for any load other than three-phase induction motors.
- * None of Toshiba, its subsidiaries, affiliates or agents, shall be liable for any physical damages, including, without limitation, malfunction, anomaly, breakdown or any other problem that may occur to any apparatus in which the Toshiba inverter is incorporated or to any equipment that is used in combination with the Toshiba inverter. Nor shall Toshiba, its subsidiaries, affiliates or agents be liable for any compensatory damages resulting from such utilization, including compensation for special, indirect, incidental, consequential, punitive or exemplary damages, or for loss of profit, income or data, even if the user has been advised or apprised of the likelihood of the occurrence of such loss or damages.

For further information, please contact your nearest Toshiba Representative or International Operations-Producer Goods. The information in this brochure is subject to change without notice.
